

ProjectOne - 12 Projects (Draft v0.1)

Purpose

The Projects module is the central workspace where every content project is created, managed, generated, tracked and completed.

Objectives

Provide a structured environment for organizing content from idea to publication while keeping every asset, workflow and decision in one place.

Core Capabilities

Create projects, organize assets, manage AI workflows, monitor generation progress, review outputs, collaborate, version projects and prepare content for publishing.

Project Lifecycle

Idea → Planning → Generation → Review → Editing → Approval → Publishing → Analytics → Archive.

Design Principles

Every project should be easy to understand, recoverable, versioned, searchable and independent from other projects.

Success Criteria

A user can manage the complete lifecycle of any content project without leaving the ProjectOne ecosystem.
