

ProjectOne - 17 Settings (Draft v0.1)

Purpose

The Settings module centralizes every personal, workspace and system configuration in a single, organized location.

Objectives

Allow users to configure accounts, AI providers, API keys, notifications, billing preferences, connected platforms, security, storage and application behavior.

Core Sections

Profile, Workspace, AI Providers, API Keys, Connected Accounts, Notifications, Security, Billing, Storage, Appearance, Integrations and Advanced Settings.

Design Principles

Organized, searchable, transparent, safe by default and easy to navigate without exposing unnecessary complexity.

Security

Sensitive operations require confirmation. API keys are encrypted, permissions are clearly displayed and users retain full control over connected services.

Success Criteria

Users can configure every aspect of ProjectOne from one location without confusion while maintaining security and transparency.
