

ProjectOne - 20 AI Architecture (Draft v0.1)

Purpose

The AI Architecture defines how every artificial intelligence component inside ProjectOne communicates, collaborates and scales.

Objectives

Provide a modular, provider-agnostic and extensible AI foundation capable of supporting multiple models, agents and workflows.

Core Components

AI Providers, AI Router, Agent System, Memory System, Prompt Engine, Workflow Engine, Context Manager and Cost Management.

Architecture Principles

Provider independence, modularity, transparency, scalability, fault tolerance, observability and user control.

Request Flow

User Request → Context Collection → Model Selection → Agent Execution → Quality Validation → Response → Memory Update.

Provider Strategy

Support automatic or manual provider selection, BYOK, retries, fallbacks and provider replacement without affecting the user experience.

Success Criteria

The AI layer can evolve independently from the rest of the platform while remaining reliable, transparent and easy to extend.
