

ProjectOne - 22 Memory System (Draft v0.1)

Purpose

The Memory System defines how ProjectOne stores, retrieves and applies information to create a personalized and context-aware AI experience.

Objectives

Provide long-term context, reduce repetitive user input, improve AI decisions and maintain strict user control over stored information.

Memory Layers

Conversation Memory, Project Memory, Channel Memory, Workspace Memory and User Preference Memory.

Memory Principles

Store only useful information, organize memories by scope, allow editing and deletion, and never hide what the AI remembers.

Retrieval Flow

Request → Context Detection → Relevant Memory Retrieval → AI Execution → Optional Memory Update.

Privacy & Control

Users can inspect, edit, disable or delete memories at any time. Memory is isolated between workspaces and channels where appropriate.

Success Criteria

The AI consistently remembers relevant context without becoming inaccurate, intrusive or difficult for users to manage.
