

ProjectOne - 23 AI Providers (Draft v0.1)

Purpose

The AI Providers module defines how ProjectOne integrates, manages and switches between multiple AI providers while remaining provider-agnostic.

Objectives

Support multiple models, maximize reliability, optimize costs and allow users to choose or replace providers without changing workflows.

Supported Capabilities

Bring Your Own Key (BYOK), automatic or manual provider selection, health monitoring, retries, fallbacks, cost tracking and provider replacement.

Provider Principles

No provider lock-in, transparent pricing, modular integrations, isolated failures and consistent user experience regardless of provider.

Selection Flow

User Preference → Capability Check → Availability Check → Cost Evaluation → Provider Selection → Execution → Monitoring.

Failure Handling

If a provider fails, ProjectOne retries according to policy, falls back when possible, logs the event and informs the user when required.

Success Criteria

Users can freely change AI providers while ProjectOne maintains stable, predictable and transparent operation.
