

ProjectOne - 30 Backend Architecture (Draft v0.1)

Purpose

The Backend Architecture defines the core services that power ProjectOne and expose secure, scalable functionality to every client application.

Objectives

Provide a modular, secure and scalable backend capable of supporting AI workflows, authentication, storage, billing and integrations.

Core Components

API Layer, Authentication, Business Logic, AI Services, Workflow Engine, Database Access, File Storage, Billing Services and Background Workers.

Architecture Principles

Modular services, stateless APIs where possible, event-driven processing, fault tolerance, observability and horizontal scalability.

Responsibilities

Validate requests, enforce permissions, orchestrate workflows, manage data, integrate external services and expose consistent APIs.

Success Criteria

The backend remains reliable, maintainable and independently scalable as ProjectOne grows.
