

ProjectOne - 32 API Architecture (Draft v0.1)

Purpose

The API Architecture defines how every client, AI service and external integration communicates with the ProjectOne backend through secure, consistent and versioned interfaces.

Objectives

Provide reliable APIs that are scalable, well-documented, secure and easy to extend without breaking existing integrations.

Core API Domains

Authentication, Users, Workspaces, Projects, AI, Workflows, Assets, Analytics, Billing, Notifications, Integrations and Administration.

API Principles

REST-first design, predictable endpoints, versioning, idempotent operations where appropriate, standardized responses and comprehensive error handling.

Security

Authentication, authorization, rate limiting, request validation, audit logging and encrypted transport are mandatory for all endpoints.

Success Criteria

The API remains stable, consistent and backward compatible while supporting future platform expansion.
