

ProjectOne - 21 Agent Architecture (Draft v0.1)

Purpose

The Agent Architecture defines how specialized AI agents cooperate to complete complex workflows while remaining modular, transparent and independently scalable.

Objectives

Assign clear responsibilities to every AI agent, enable collaboration, minimize duplicated work and maintain predictable execution.

Core Agent Types

Planning Agent, Research Agent, Script Agent, Media Generation Agent, Video Assembly Agent, Quality Assurance Agent, Publishing Agent, Analytics Agent and Strategy Agent.

Communication Model

Agents exchange structured context, intermediate outputs and execution status through the workflow engine instead of communicating directly.

Execution Principles

Each agent has a single responsibility, defined inputs and outputs, measurable success criteria and full execution logs.

Approval Model

Workflows may run fully autonomously or pause for user approval after selected agent stages depending on workspace configuration.

Success Criteria

New agents can be added, replaced or upgraded without affecting existing workflows or requiring major architectural changes.
