

ProjectOne - 24 Workflow Engine (Draft v0.1)

Purpose

The Workflow Engine coordinates every automated process inside ProjectOne, ensuring that tasks execute in the correct order with full visibility and reliability.

Objectives

Orchestrate AI agents, manage dependencies, support parallel execution, recover from failures and provide users with complete workflow transparency.

Core Capabilities

Workflow creation, execution, scheduling, approvals, checkpoints, retries, branching, notifications and execution history.

Execution Principles

Every workflow is deterministic, observable, resumable, versioned and independently executable.

Workflow Lifecycle

Trigger → Validation → Planning → Agent Execution → Quality Checks → User Approval (optional) → Completion → Analytics → Archive.

Failure Recovery

Failed workflows can pause, retry, resume from checkpoints or terminate safely while preserving execution history.

Success Criteria

Users can automate complex multi-step processes with confidence while understanding exactly what is happening at every stage.
