

ProjectOne - 31 Database Architecture (Draft v0.1)

Purpose

The Database Architecture defines how ProjectOne stores, organizes and protects all application data while supporting scalability, performance and reliability.

Objectives

Provide a structured, normalized and extensible data model that supports AI workflows, projects, users, billing, analytics and future platform growth.

Core Domains

Users, Workspaces, Channels, Projects, Assets, AI Memory, Workflows, Providers, Billing, Notifications, Analytics and Audit Logs.

Architecture Principles

Clear ownership of data, strong relationships, versioning where required, soft deletion, auditability and high performance.

Data Integrity

Use constraints, transactions, indexing and validation to ensure consistent and reliable information across the platform.

Success Criteria

The database remains scalable, maintainable and capable of supporting future features without requiring major structural redesign.
