

ProjectOne - 43 Deployment Strategy (Draft v0.1)

Purpose

Define how ProjectOne is deployed safely, consistently and with minimal downtime across all environments.

Environments

Development, staging and production remain isolated, each with dedicated configuration and validation.

Deployment Process

Every deployment is automated through CI/CD, including build verification, testing and approval gates.

Rollback Strategy

Production deployments must support rapid rollback to the last known stable version if critical issues occur.

Monitoring

Deployments are followed by health checks, logging, metrics and alerting to detect regressions immediately.

Success Criteria

Deployments are repeatable, secure and reliable while enabling frequent product releases.
